

Plain roof

## Plain roof

**A roof with a high load cannot always be lined. The roof, together with the façade, forms the visual architectural structure of a building. A plain roof however, gives you the opportunity to have stylish roofing.**

### Why choose a plain roof?

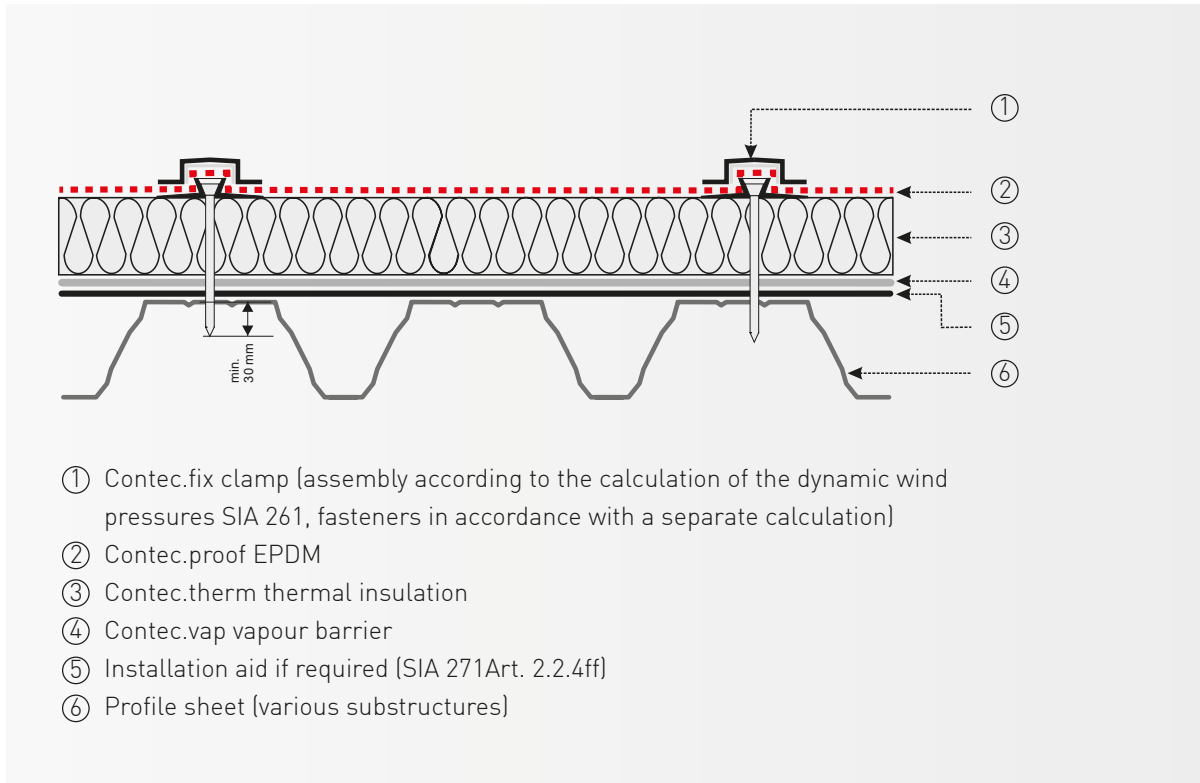

The advantages of a plain roof are, for example, evident in large industrial buildings. For structural reasons, the sealing (landscaping) must often be installed without a further load on the roof. The 1.5mm thick Contec.proof seal, which is mechanically attached, gives the roof an exceptional appearance despite or actually because of the black or grey surface. This also applies to small properties. The roofs are not always transformed into landscaped gardens, but it is still important for them to look good.

Very important: our mechanical fasteners do not pierce the roof surface (see detailed example).

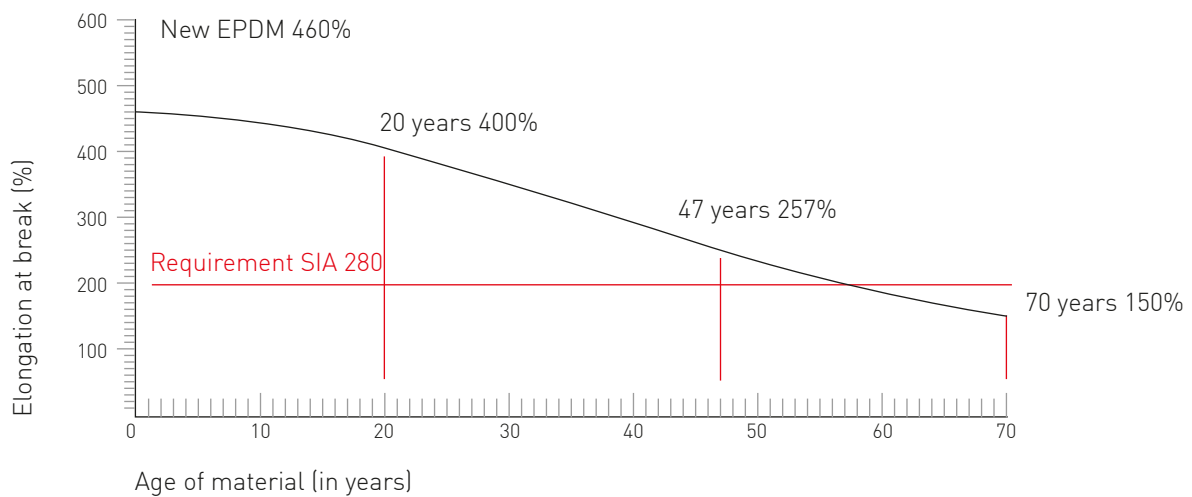

## Mechanical fastening

Example: Warm roof as a plain roof

### Resistance

#### Why Contec?

- The waterproofing does not pierce the roof
- UV-resistant
- Elongation at break of 460%, 257% after 47 years
- Service and quality assurance

## References

**25 years experience. Over 65,000 buildings. Over 10 million m<sup>2</sup>.  
From single family homes to large-scale industry.**
